Intranasal RSV Vaccine Clinical Trial for Toddlers and Preschoolers

We want to learn if an investigational respiratory syncytial virus (RSV) nasal vaccine (delivered to the nose as a spray) is safe and could offer protection against RSV disease. RSV is a common respiratory virus that can be very serious for infants, children and older adults. It is one of the leading causes of hospitalization for infants and children.

WHO?

Healthy children 12 months to 30 months old.

STUDY DETAILS

- 8-12 planned visits over 2 years
- Compensation for your time
